# Pakka

## Every WhatsApp order, exactly as agreed.

An AI order copilot for small businesses that sell on WhatsApp.

Pooja Esakkimuthu · AI PM Bootcamp, BYOP capstone

pakka-app.vercel.app

# One missed detail ruins an occasion

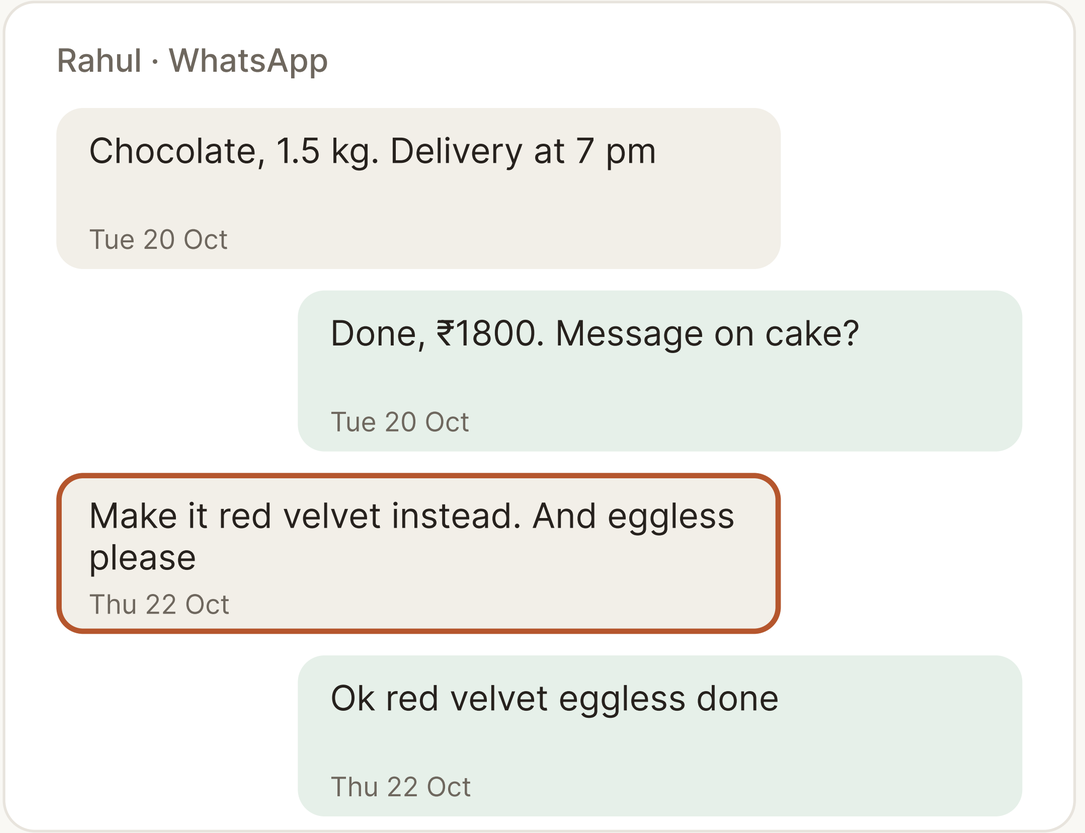

Custom orders are negotiated over days: texts, photos, voice notes, payment screenshots.

Then the customer changes the flavour, and nothing records it.

So the owner scrolls back and rebuilds the order from memory.

*"Once I made chocolate when she had changed it to red velvet two days before. I felt so bad."*

Kavya, home baker (illustrative quote)

Illustrative: the order is in the chat, but its current version is not written down anywhere.

# Who has it

Small owners working alone or with a helper, on one WhatsApp number.

K

## Kavya

Solo home baker

Scrolls back through chats to rebuild every order before baking.

A

## Ayesha

Bakery owner with two helpers, 20 to 30 orders a week

Helpers agree to things she never sees, and the notebook is always out of date.

D

## Divya

Part-time helper

Does not know what was already agreed before replying to a customer.

Based on conversations with small business owners who track orders in notebooks, workbooks and phone notes.

**Beachhead: home bakers. Next: sarees, jewellery and direct food orders.**

# Root cause: no record of the order

The chat creates the order, but nothing keeps a record of what was agreed.

**WHY 1**
Orders go out wrong

→

**WHY 2**
Her version of the order is outdated

→

**WHY 3**
There is no single record of it

→

**WHY 4**
Updating means re-copying by hand

→

**WHY 5**
Nothing turns the chat into a record

## Root cause, not a symptom.

The record exists in the chat, but the current state of the order is never written down. That is why a summary alone would not fix it.

# A live order ticket for every order

Pakka works in the background. The owner keeps using WhatsApp exactly as she does today.

1

## Listens

Every customer message and business reply arrives in real time.

2

## Reads

The AI model finds the order and details, with the exact words it relied on.

AI model

3

## Applies the rules

Plain code checks the quotes, then applies, holds or flags each change.

Plain code

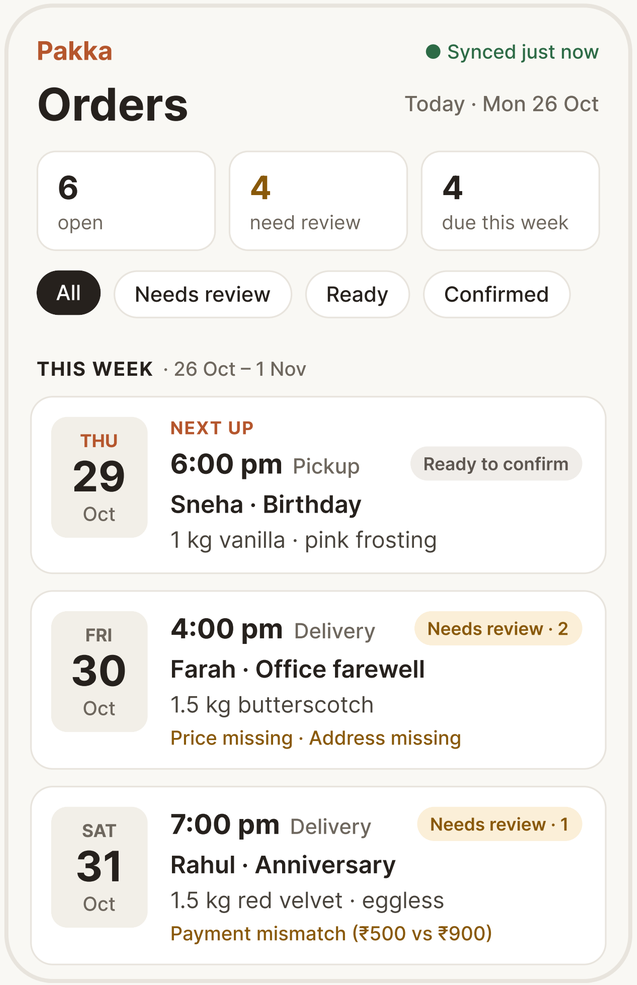

4

## Owner reviews

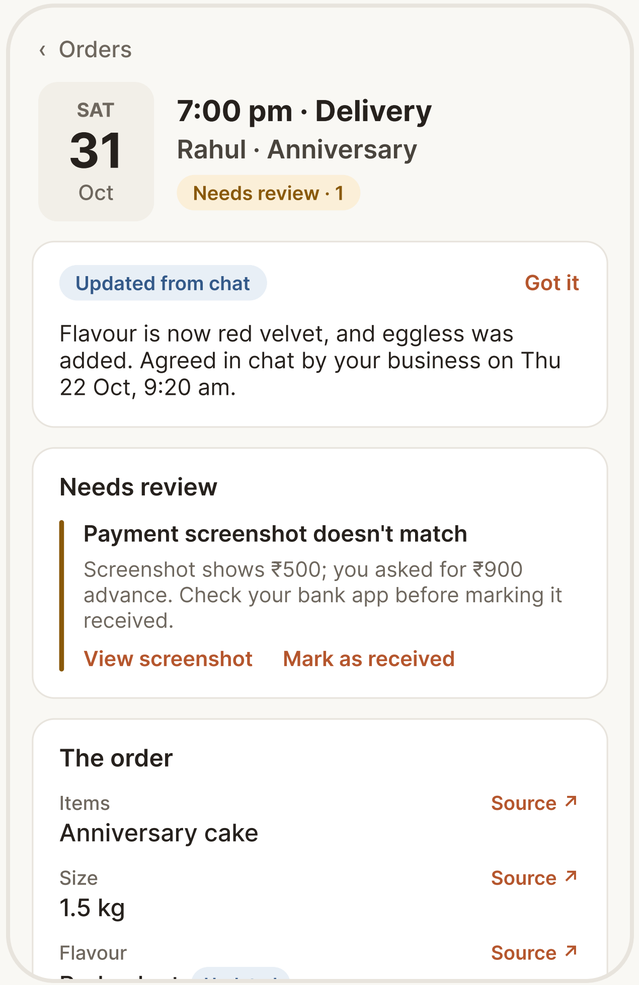

She sees only what needs review, and confirms with one tap.

**Pakka never:** replies to customers · guesses missing details · marks a payment as paid

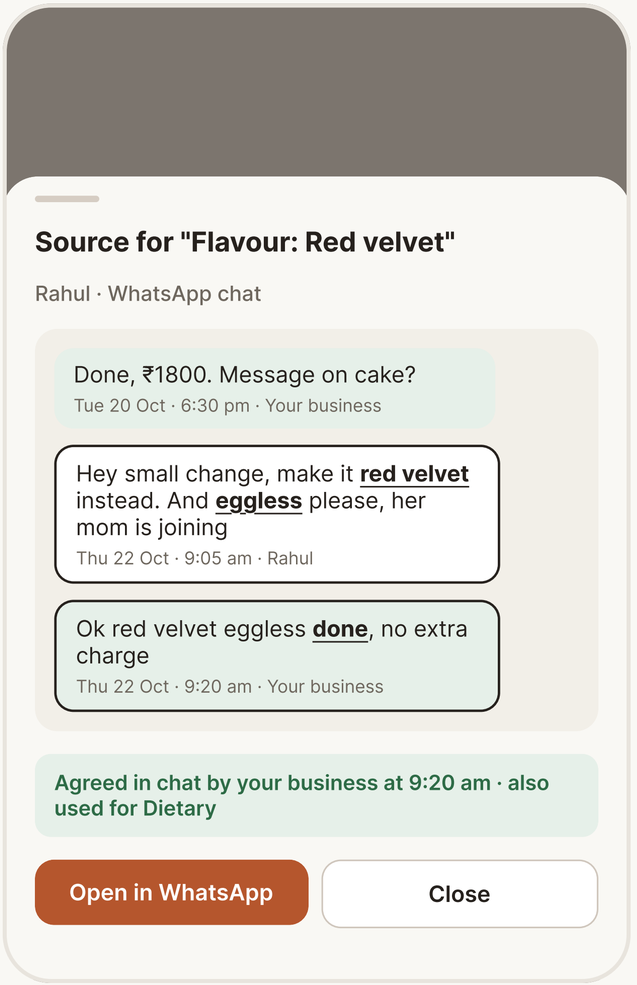

# Watch one order change

1 · The week at a glance

2 · Changes and details, sourced

3 · The exact messages behind it

# The model reads. Code decides.

The AI never writes to the database and never talks to customers.

## Quote check

Every detail must come with the exact words from the chat. Code verifies them before anything is saved.

## No "paid" without the owner

A screenshot stays "not verified" until the owner checks her bank app and marks it received.

## Maths in code

Balances, required fields and statuses are calculated by plain code, never guessed by the model.

## The owner stays in charge

Only the owner confirms an order. Anything unclear goes to Needs review. Pakka never replies to customers.

# Why not just ChatGPT?

Because an order needs a memory, not a summary.

## A chatbot

- Gives one summary of one pasted chat
- Forgets the order next time
- Cannot show where a detail came from

## Other WhatsApp tools

- Reply to customers on your behalf
- Or need every chat exported by hand
- Built for menus and campaigns, not changing custom orders

## Pakka

- Reads the live chat, nothing to export
- Keeps one ticket and a history of changes
- Every detail sourced, and the owner stays in charge

# How we will know it works

NORTH STAR

**98%**

## of orders delivered with zero detail errors

Owner-reported, in a closed beta. Also tracked: a complete ticket 24 hours before it's due (90%), under a minute to know an order's state, and 70% of owners dropping their separate notebook.

**150 / 150**

## checks passed in the prototype

7 scenarios, 50 checks, each run 3 times

**1.6 s**

## average model call

95th percentile 2.5 s, well inside the 10 s target

*Honest note: the scenarios were used while fixing problems, so a held-out set of about 60 fresh messages comes before beta.*

# What it costs, and what to charge

## ₹215–260

**per business per month**

AI and hosting at 100 orders a month, from measured token use.

## $0.0014

**per message**

Gemini 3.5 Flash-Lite: 2,687 tokens in and 244 out on average.

## ₹799

**recommended launch price**

About 68% margin. At ₹499 the margin falls to 49% and goes negative if usage triples.

The cost estimate shaped the model choice: a lite model with low thinking kept the product affordable for small owners.

Exchange rate about ₹96.5 per US dollar. Costs move with it.

# Risks, and how we handle them

| | |
|---|---|
| **Real WhatsApp needs Meta's approval** | Go through a Tech Provider or a partner. The webhook is already built. |
| **Meta delivers edits as unsupported messages** | Shown as "couldn't be read" until Meta fixes it. The edit logic is tested in the simulator. |
| **Free-tier model, synthetic data only** | Production uses a paid tier that excludes training on customer data, with a DPDP review. |
| **The model varies a little between runs** | Clear field descriptions, a missing-field flag the owner can fill in, and evals repeated three times. |

# Next steps

NOW

## Working prototype

Live at pakka-app.vercel.app. 7 scenarios, 150 of 150 checks.

NEXT

## Prove it on real traffic

Live test with Meta, plus a held-out eval set of about 60 messages.

Q1 2027

## Closed beta

10 to 20 home bakers, through a Tech Provider or a partner.

THEN

## More custom-order businesses

Sarees, jewellery and direct food orders.

# Pakka doesn't take orders. It makes sure they go out right.
